HOW TO GUIDE

GMV's Checker ATM Security®

based on ALMEFY Authentication Technology

Last Update: March 2023

GMV's Checker ATM Security®
# based on ALMEFY Authentication Technology

How it works – Checker Server Console Access with Almefy

Checker can optionally be configured to log in with Almefy allowing 2FA login in a single step.

If Almefy has been configured in your environment, your login screen will look like this:

Before using Almefy to log in, you'll have to register your Checker user with Almefy. To do that, open the top right dropdown menu and select the "Try Almefy" option:

Clicking on that option will open the following screen:

If you want to use Almefy, click on the "Send activation e-mail" and follow the instructions provided. Once you've activated Almefy for your account, you'll be able to log into the application just with the Almefy app. You'll still be able to use the user/password authentication if needed.

How it works – Checker Operator Access at the ATM

Almefy authentication integrated with Checker at the ATM allows local access using 2FA to the ATM Operating System by means of a Checker Secure USB drive.

Previously to a first 2FA, the technician should have to:

- Download ALMEFY App at his smartphone.
- Request user registration to the Checker Administration.

Once the user is properly registered in the Almefy service. The technician will not need any user password data to access to the ATM operating system.

The operation will be very simple: the user should connect a Checker Secure USB drive device to the ATM and automatically the ATM will show a QR code at the center of the screen:

The user should open Almefy App on his smartphone, capture this QR code and immediately the user will be granted to access the ATM operating system. No user /password needed.
